MultiDroid: A Novel Solution to Consolidate Interactive Physical Android Clients on One Single Computing Platform

A stylized illustration featuring several black penguins standing on top of blue shipping containers. The containers are arranged in a cluster, with some in the foreground and others in the background. The background is a light blue gradient.

Agenda

- Background and Scenarios
- Solution
- Evaluation
- Summary and Next

Background

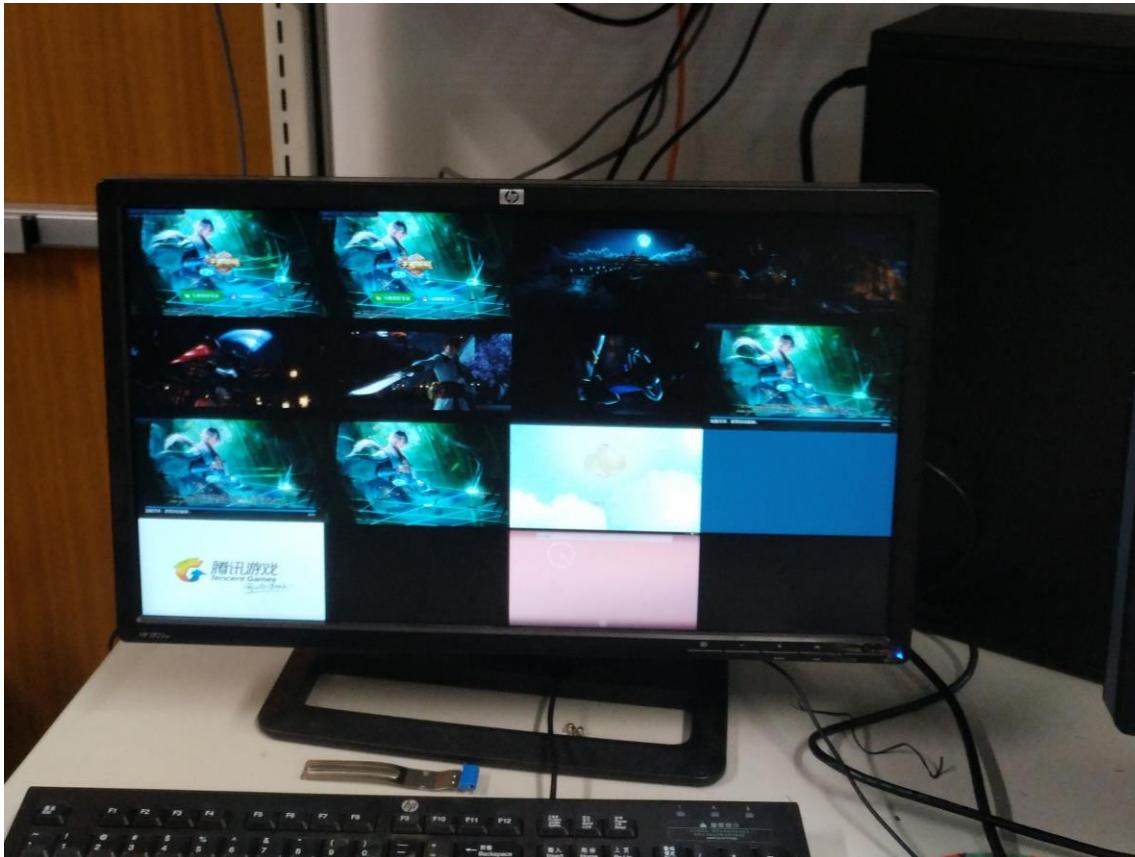

- Leverage computing power of modern CPU to consolidate workloads
- Requirements come from different scenarios such as Retail, Automotive and Game cloud.

Scenario: Rear Seat Entertainment

- HVAC
- Video
- Music
- Game
- Map
- Conference

Scenario: Cloud Gaming

Scenario: Robot

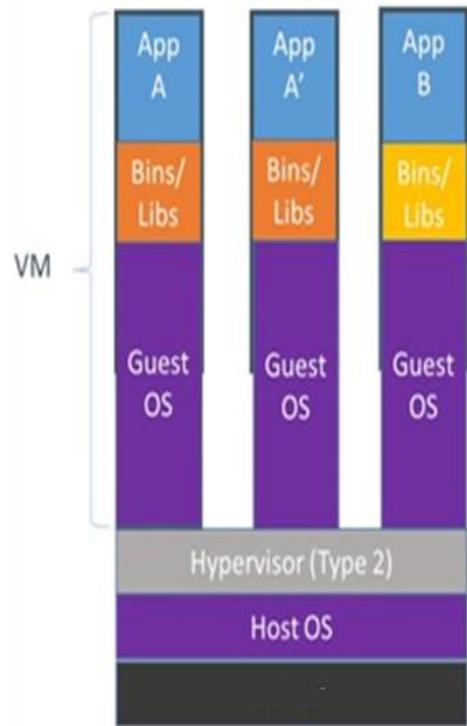

Scenario: Auto Vending Machine

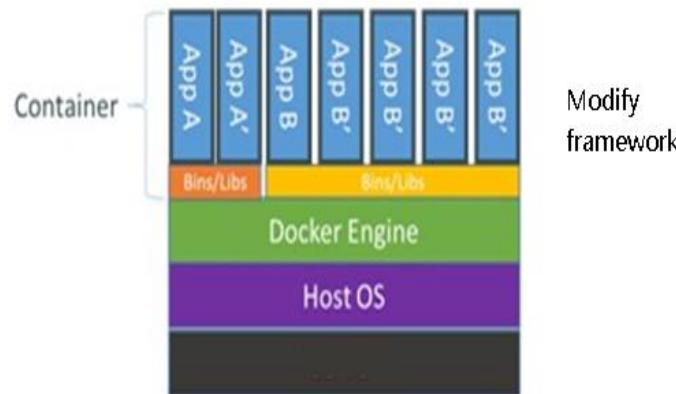

Solution - *MultiDroid*

- Solutions Comparing
- Architecture
- Advantages
- Implementation

Solutions Comparing

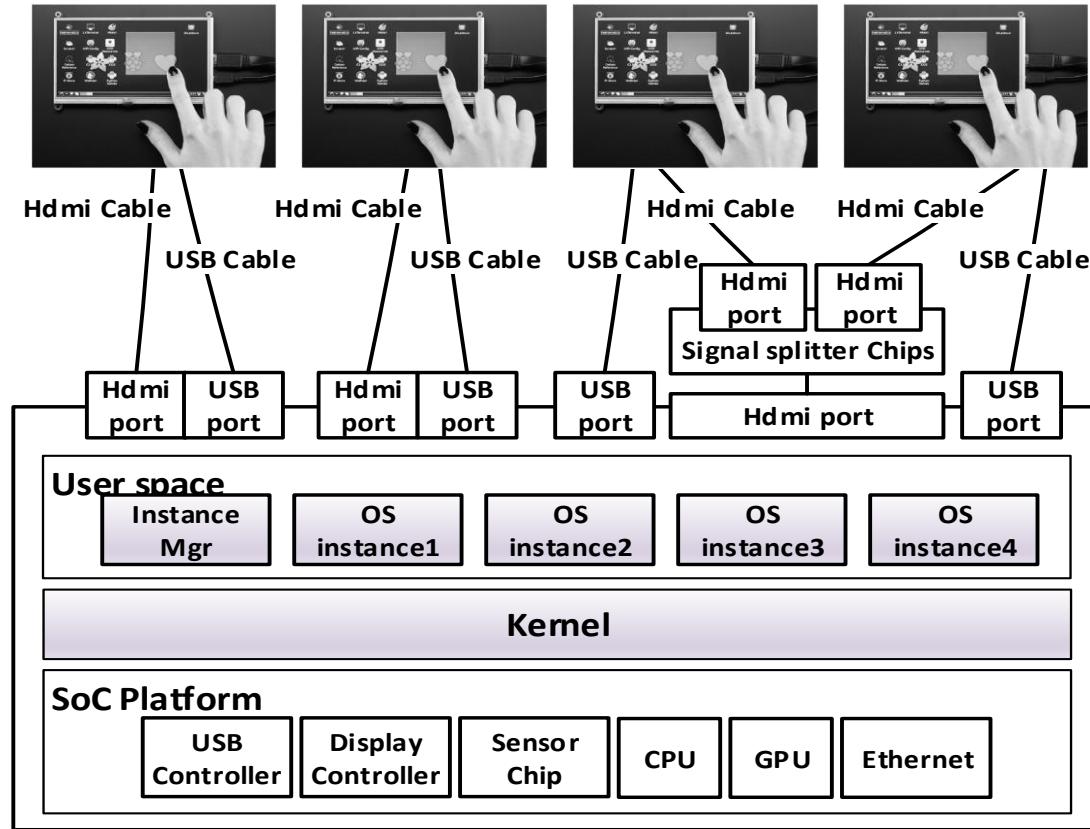

Containers are isolated,
but share OS and, where
appropriate, bins/libraries

Modify
framework

Architecture

Advantages

- Lightweight
- Supports different Linux-based OS
- Little overhead.
- Simple I/O sharing solution.
- Recovery mechanism
- Security Guarantee
- Easy Deployment & Maintenance

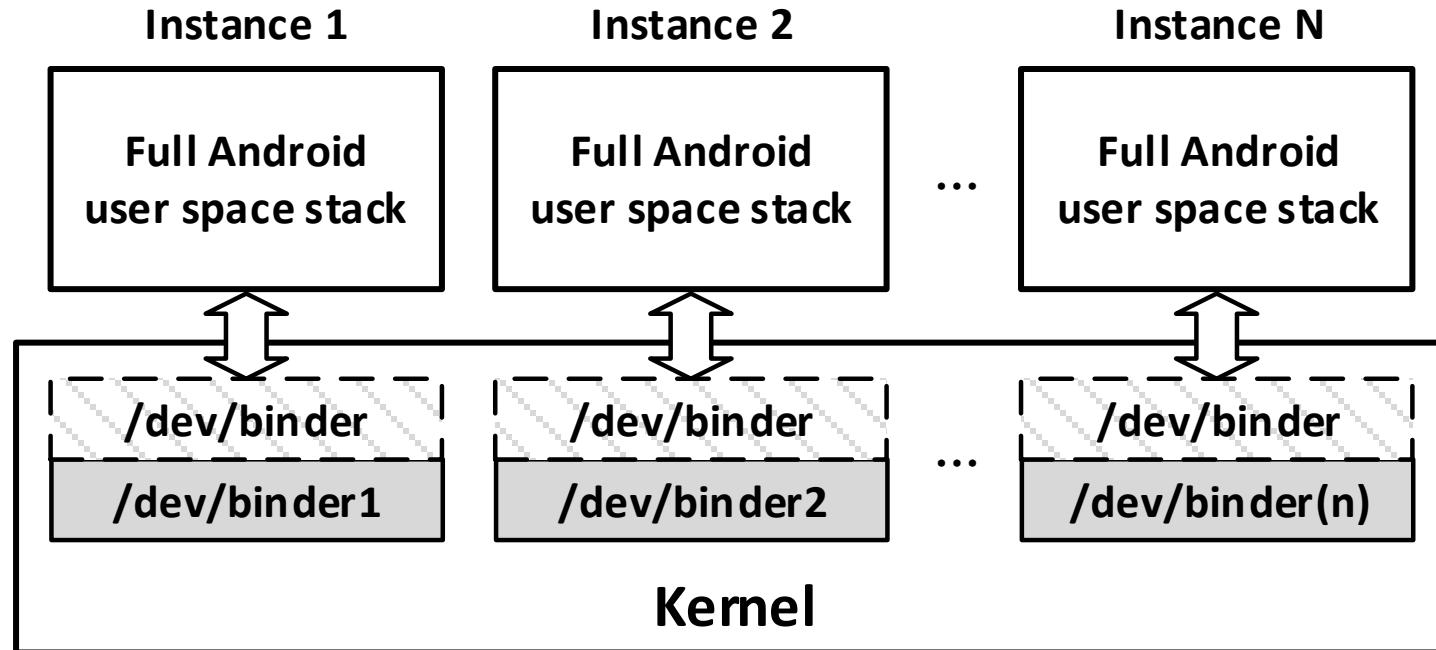

Implementation: MultiDroid

- File System Layout
- Kernel
- I/O Devices Virtulization
- AOSP

File System Layout

- Different data partitions for different Android instances.
- `system.img` is shared between different Android instances.
- Overlay fs can be used if different `system.img` is required.

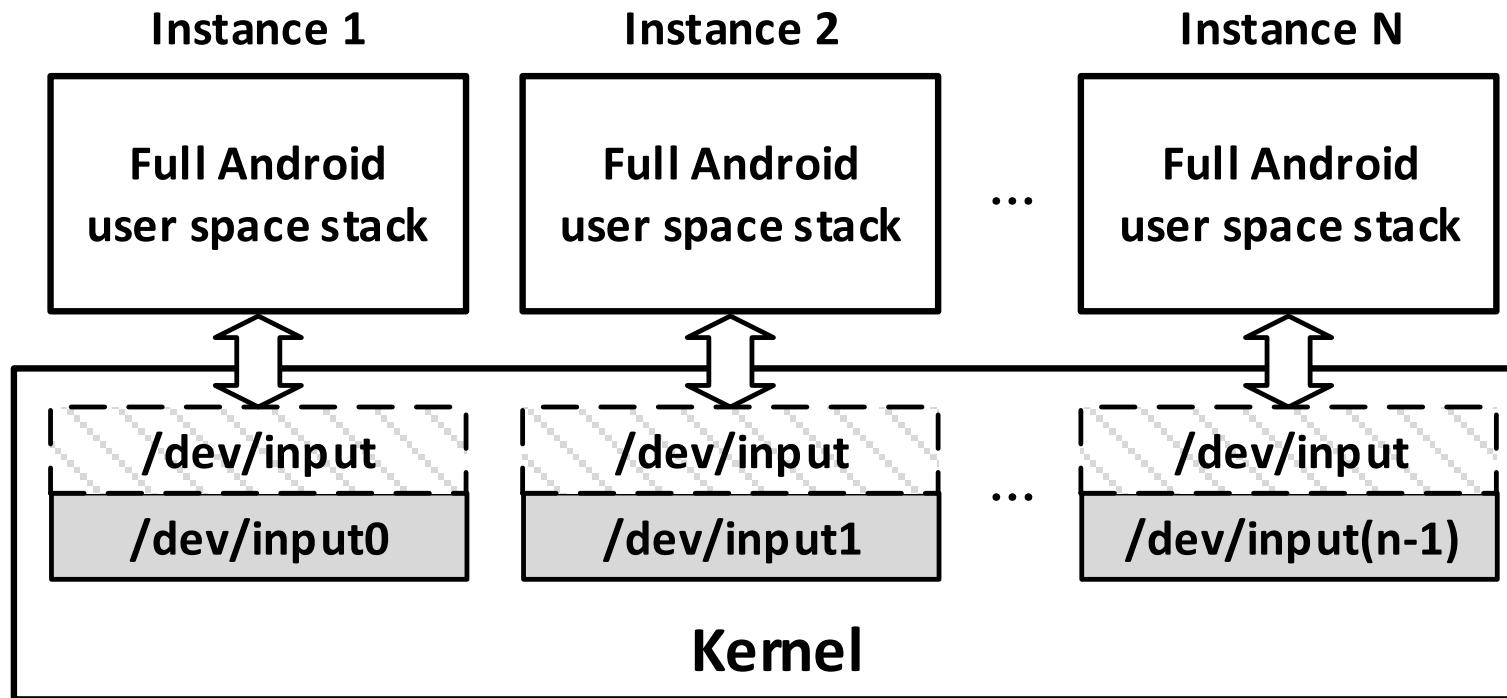

Kernel - Binder

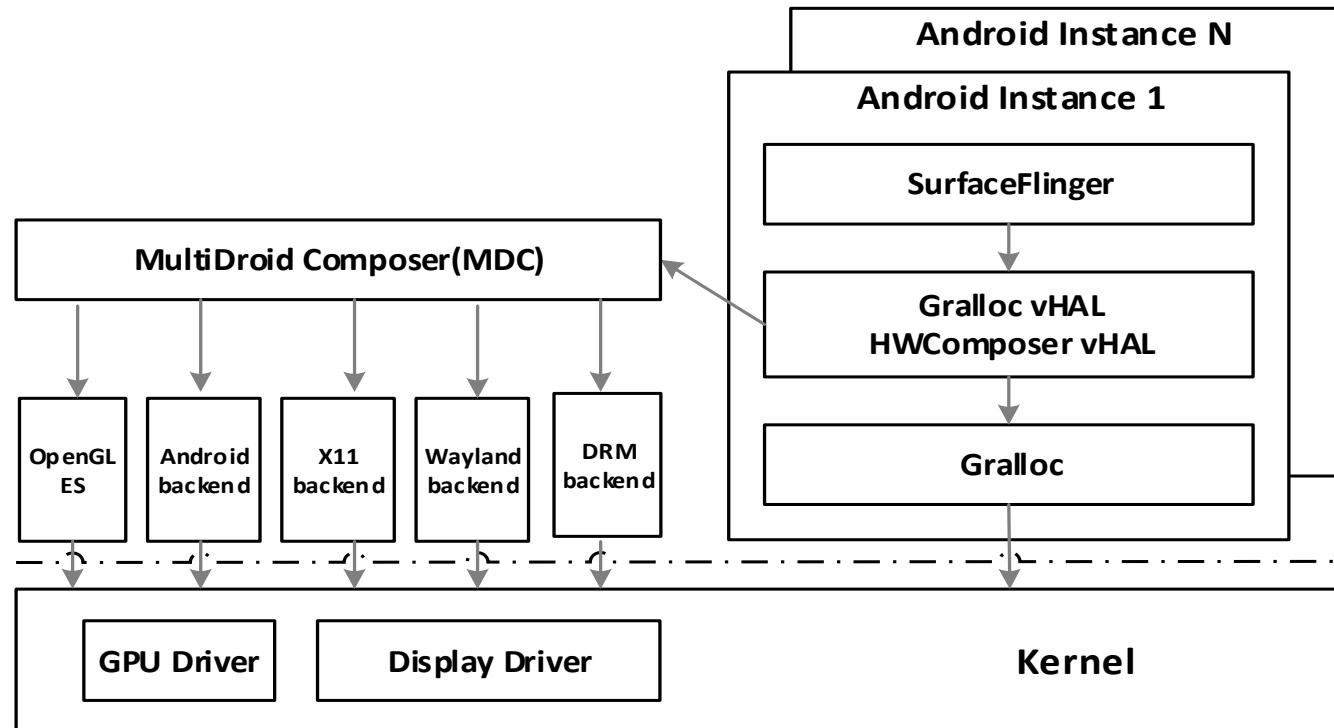

I/O Devices Virtualization

- Dedicated I/O devices
 - e.g. Usb Host
- Shared I/O devices
 - e.g. GFX, Trusty

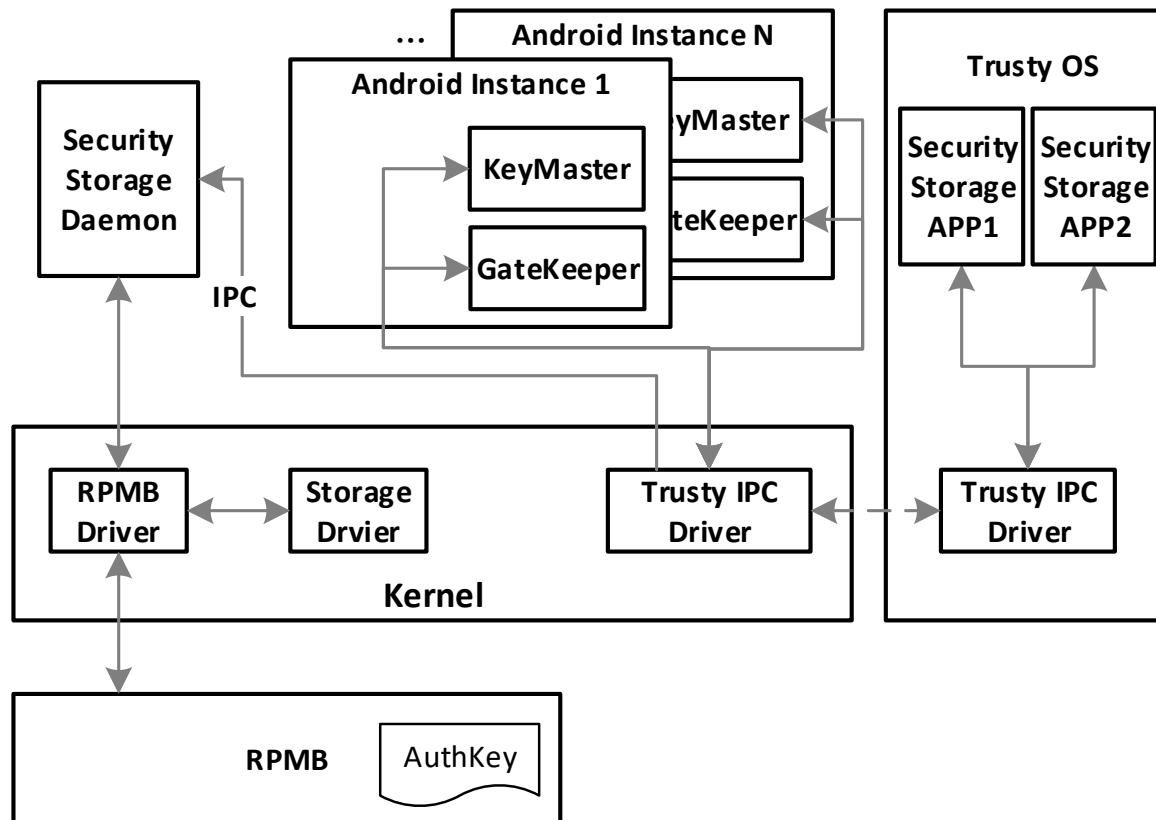

I/O - USB Touch

I/O – GFX and Display

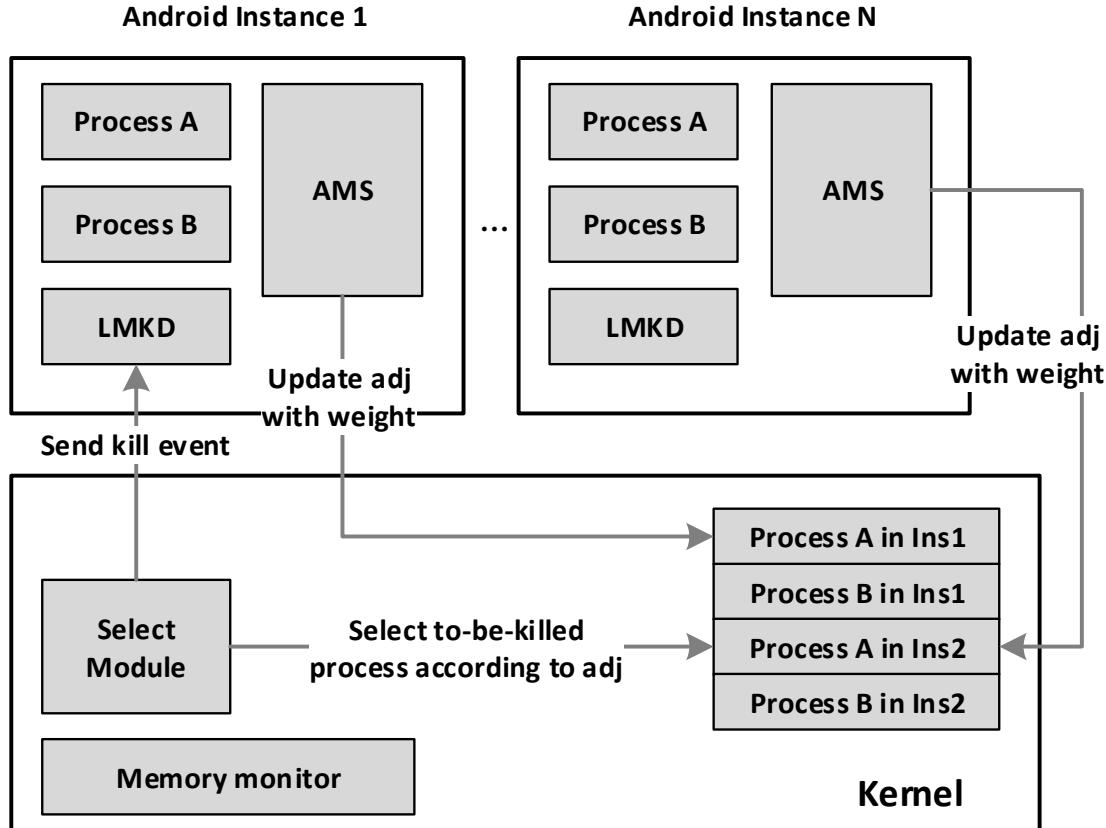

I/O - Trusty

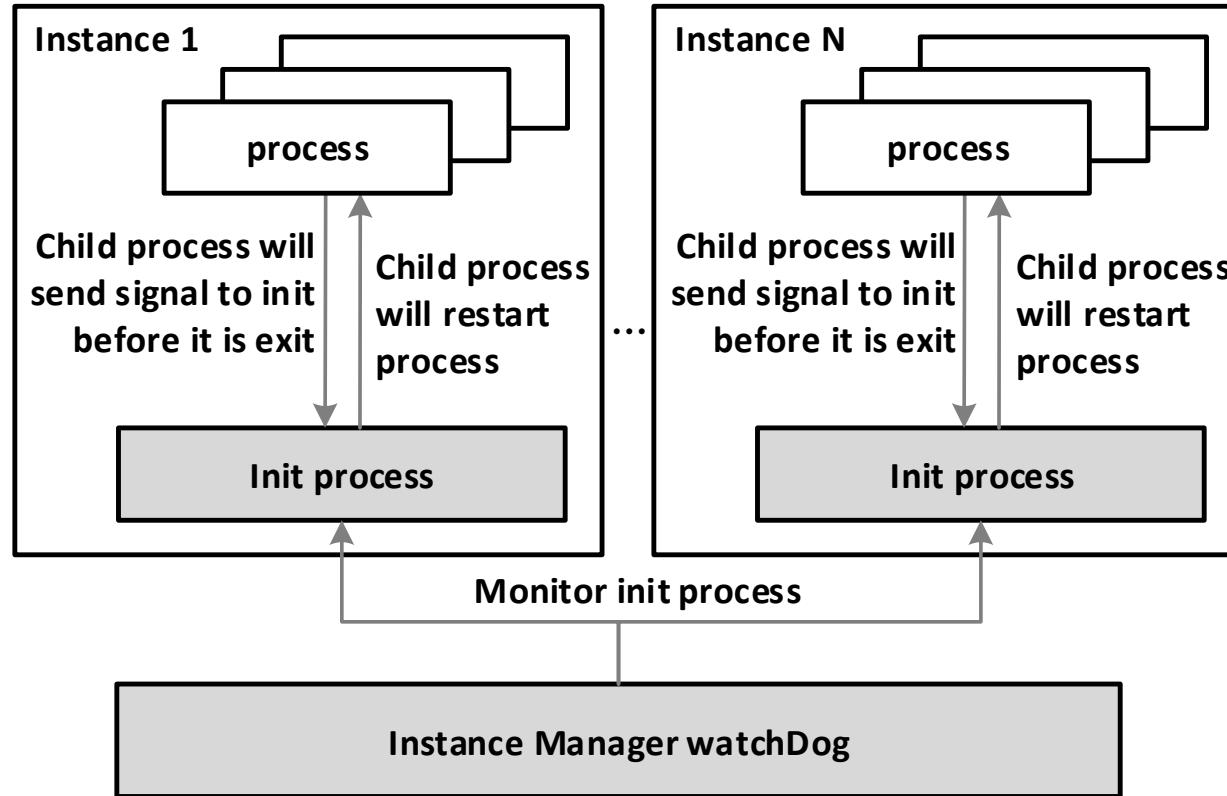

- Low memory Killer
- Recovery

Low Memory Killer

Recovery

Evaluation

- Environment setup
- Evaluation result

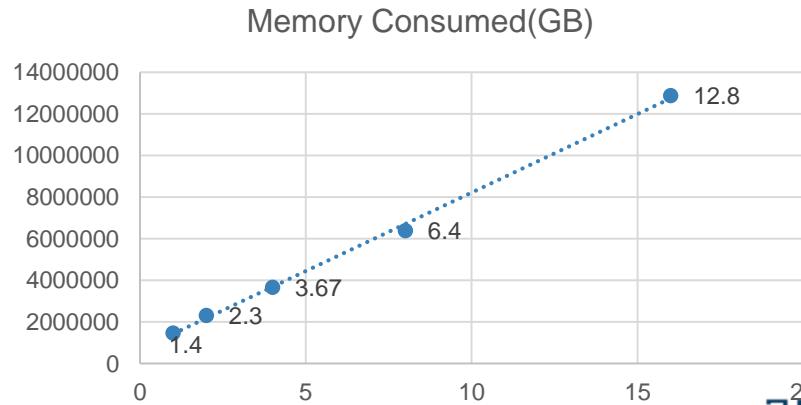

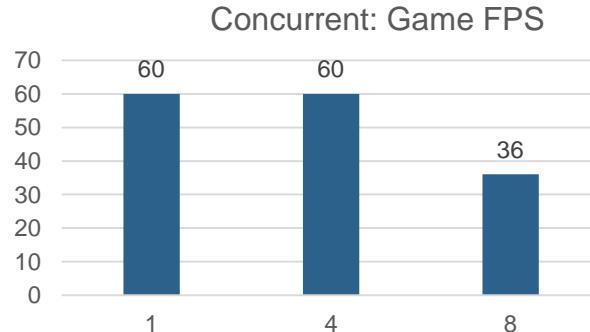

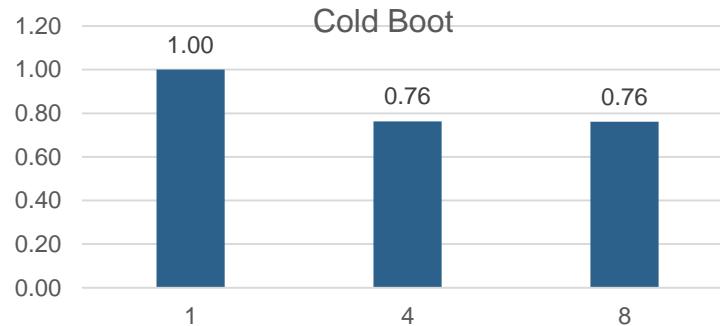

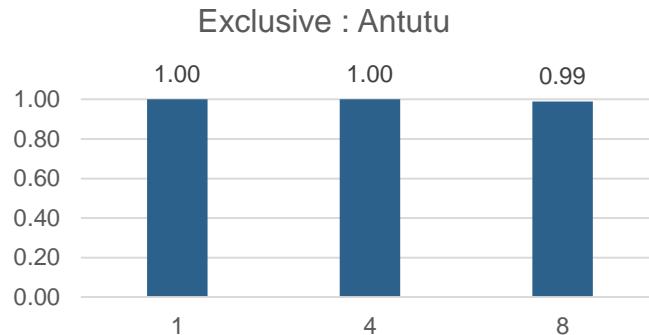

Evaluation Setup

- Exclusive test: single active instance while multiple instances are created but in idle state
- Concurrent test: system performance where multiple instances run with continuous workload simultaneously
- Memory consumption

Hardware: Intel mini Kaby Lake PC Intel(R) Core(TM) i5-7260U
CPU @ 2.20GHz *2 /HDMI display and touch

Software: Android 7.1.2

Result

Summary

- Raised the idea to consolidate workloads using container technology.
- Designed simple I/O sharing solution.
- Implemented POC to consolidate 16 Android Instances in KabyLake Nuc.

Next

- Enhance security.
- Optimize boot time and memory usage.
- Integrate different Linux based OS in one platform.
- Explore the possibility to integrate with VM solution.
